A new DNA vector construct containing opposable promoter and terminator sequences flanking a cloning site are useful for the expression of double stranded RNA useful for inhibition of RNA in gene expression control

Claim 24; Fig 12; 75pp; English.

The present invention relates to improved vector constructs comprising two promoters in opposite orientation to each other, an inter-promoter region downstream of the 3' end of both promoters, a cloning site in the inter-promoter region and a transcription terminator downstream of the 3' end of the first promoter and the cloning site and operably linked to the first promoter. The constructs of the invention and the bacteria harbouring the constructs are used to produce double stranded RNA for RNA inhibition (RNAi) and can be used as a tool for controlling gene expression. The present sequence is pGN39 plasmid DNA

New library of prokaryotic pET-24a expression vectors, host cells nucleic acid/protein conjugates, useful for screening candidate proteins and their nucleic acids or modification enzymes for pharmacogenetic analysis

or

Example 2; Fig 59B; 127pp; English.

The invention relates to methods and compositions for the construction of prokaryotic libraries expressing candidate proteins and the use of these to identify candidate proteins and the nucleic acids encoding them. The invention provides a library of prokaryotic pET-24 vectors comprising a fusion nucleic acid consisting of a nucleic acid encoding a mucleic acid modification (NAM) enzyme or a candidate protein, or a nucleic acid having a T7 promoter operably linked to the NAM enzyme or the candidate protein, and an enzyme attachment sequence (EAS) recognised by the NAM enzyme. The library is used for identifying

0 The present invention describes isolated nucleic acid molecules (I) encoding an attB1, attB2, attB1, attB2, attB1, attB2, attB1, attB2, attB1, attB2, attB1, attB2 nucleotide sequence. Also described are: (1) an isolated nucleic acid molecule (II) comprising one or more att recombination sites comprising at least one mutation in its core region that increases the specificity of interaction between the recombination site and a second att recombination site; and (2) an isolated nucleic acid molecule (III) comprising one or more mutated att recombination sites comprising at least one mutation in its core region that enhances the efficiency of recombination between a first nucleic acid molecule comprising the mutated att recombination site and a second nucleic acid molecule candidate proteins and mucleic acids encoding these proteins, in screening for NAM enzymes with decreased toxicity for the host cells, or in identifying novel or improved EASs, which may be used for understanding cellular processes or any subsequent therapeutic or toxic activities. The nucleic acid/protein (NAP) conjugates are useful in diagnostic assays and in research including clinical pharmacology, functional genomics, pharmacogenomics, agricultural chemicals, environmental safety assessment, chemical sensor, nutrient biology, cometic research or enzymology. These may also be used in in vitro screening techniques and in assays with target molecules. The present sequence is gateway transfer cassette DNA used in the invention. attR reading frame C parent plasmid prfC Parent III nucleotide sequence. Isolated nucleic acid molecules encoding an attB1, attB2, attP1, a attL1, attL2, attR1, and attR2 nucleotide sequence useful for the recombinational cloning of polypeptides -Disclosure; Fig 46; 459pp; English.

The present invention describes isolated nucleic acid molecules (I) encoding an attB1, attB2, attB1, attB2, attB1, attB2 attB1, attB2 attB1, attB2 nucleotide sequence. Also described are: (1) an isolated nucleic acid molecule (II) comprising one or more att recombination sites comprising at least one mutation in its core region that increases the specificity of interaction between the recombination site and a second att recombination site; and (2) an isolated nucleic acid molecule (III) comprising one or more mutated att recombination sites comprising at 

The present invention describes isolated nucleic acid molecules (I) encoding an attB1, attB2, attB1, attB2, attB1, attB2, attB1, attB2, attB1, attB2 attB1, attB2 attB1, attB2 attB1, attB2 attB1, attB2 attB2 attB1, and attB2 molecule (II) comprising one more att recombination sites comprising at least one mutation in its core region that increases the specificity of interaction between the recombination site and a second att recombination site; and (2) an isolated nucleic acid molecule (III) comprising one or more mutated att recombination sites comprising at

```
recombination between a first nucleic acid molecule comprising the mutated att recombination site and a second nucleic acid molecule comprising the comprising a second recombination site and a second nucleic acid molecule comprising a second recombination site that interacts with the mutated att recombination site. (I), (II), (III), primers, vectors and methods from the present invention are used for the recombinational cloning of nucleic acid molecules. They can be used for charging vectors, targeting gene products to intracellular locations, cleaving fusion tags from desired proteins, operably linking nucleic acid molecules of interest to regulatory genetic sequences, constructing genes for fusion proteins, changing copy number, changing replicons, cloning into phages and cloning into phages and production of polypeptides and antibodies. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                              ;

Isolated nucleic acid molecules encoding an attB1, attB2, attP1, a attL1, attL2, attR1, and attR2 nucleotide sequence useful for the recombinational cloning of polypeptides -

Example 15; Fig 28; 459pp; English.

The present invention describes isolated nucleic acid molecules (I) encoding an attB1, attB2, attB1, attB2, attB1, attB2, attB1, attB2 attB1, attB2 attB1, attB2 attB1, attB2 attB1, attB2 attB1 and attB2 muclecide sequence. Also described are: (1) an isolated nucleic acid molecule (II) comprising one or more att recombination sites comprising at least one mutation in its core region that increases the specificity of interaction between the recombination site and a second att recombination site; and (2) an isolated nucleic acid molecule (III) comprising one or more mutated att recombination sites comprising at

attP2, Isolated nucleic acid molecules encoding an attB1, attB2, attP1, attL1, attL2, attR1 and attR2 nucleotide sequence useful for the recombinational cloning of polypeptides  $^{-}$ 

Disclosure; Fig 35; 459pp; English.

The present invention describes isolated nucleic acid molecules (I) encoding an attB1, attB2, attB2, attB1, attB2, attB1, attB2, attB1, attB2 attB1, attB2 attB2, and attB2 nucleide sequence. Also described are: (I) an isolated nucleic acid molecule (II) comprising one or more att recombination sites comprising at least one mutation in its core region that increases the specificity of interaction between the recombination site and a second att recombination site; and (2) an isolated nucleic acid molecule (III) comprising one or more mutated att recombination sites comprising at

least one mutation in its core region that enhances the efficiency of recombination between a first nucleic acid molecule comprising the mutated att recombination site and a second nucleic acid molecule comprising a second recombination site that interacts with the mutated att recombination site. (1), (11), (111), primers, vectors and methods from the present invention are used for the recombinational cloning of nucleic acid molecules. They can be used for changing vectors, targeting easier products to intracellular locations, cleaving fusion tags from desired proteins, operably linking nucleic acid molecules of interest to regulatory genetic sequences, constructing genes for fusion proteins, changing replicons, cloning into phages and cloning. (1), (11), (111), host cells and vectors can be used in the exemplification of the present invention.

Isolated nucleic acid molecules encoding an attB1, attB2, attP1, attP2, attL1, attL2, attR1 and attR2 nucleotide sequence useful for the recombinational cloning of polypeptides -

Example 5; Fig 44; 459pp; English.

encoding an attB1, attB2, attB1, attB2, attL1, attL2, attR1, and attR2 nucleotide sequence. Also described are: (1) an isolated nucleic acid molecule (II) comprising one or more att recombination sites comprising at least one mutation in its core region that increases the specificity of interaction between the recombination site and a second att recombination site, and (2) an isolated nucleic acid molecule (III) present invention describes isolated nucleic acid molecules (I)

encoding an attB1, attB2, attP1, attP2, attL1, attL2, attR1, and attR2 nucleotide sequence. Also described are: (1) an isolated nucleic acid molecule (II) comprising one or more att recombination sites comprising at least one mutation in its core region that increases the specificity of interaction between the recombination site and a second att recombination site, and (2) an isolated nucleic acid molecule (III)

The present invention describes isolated nucleic acid molecules (I)

```
least one mutation in its core region that enhances the efficiency of recombination between a first nucleic acid molecule comprising the comprising a second bracion site and a second nucleic acid molecule comprising a second recombination site that interacts with the mutated att recombination site. (I), (II), (III), primers, vectors and methods from the present invention are used for the recombinational cloning of nucleic acid molecules. They can be used for changing vectors, rargeting gene products to intracellular locations, cleaving fusion tags from regulatory genetic sequences, constructing genes for fusion proteins, changing copy number, changing replicons, cloning into phages and cloning: (I), (III), host cells and vectors can be used in the production of polypeptides and antibodies. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Isolated nucleic acid molecules encoding an attB1, attB2, attP1, attP2, attL1, attL2, attR1, and attR2 nucleotide sequence useful for the recombinational cloning of polypeptides -

Isolated nucleic acid molecules encoding an attB1, attB2, attP1, attP2, attL1, attL2, attR1, and attR2 nuclectide sequence useful for the recombinational cloning of polypeptides -WPI; 2000-543948/49.

Disclosure; Fig 41; 459pp; English.

The present invention describes isolated nucleic acid molecules (I) encoding an attB1, attB2, attB1, attB2, attB1, attB2, attB1, and attR2 nucleotide sequence. Also described are: (I) an isolated nucleic acid molecule (II) comprising one or more attrecombination sites comprising at least one mutation in its core region that increases the specificity of interaction between the recombination site and a second attrecombination site; and (2) an isolated nucleic acid molecule (III) 

comprising one or more mutated att recombination sites comprising at least one mutation in its core region that enhances the efficiency of recombination between a first nucleic acid molecule comprising the mutated att recombination site and a second nucleic acid molecule comprising a second recombination site that interacts with the mutated comprising a second recombination site that interacts with the mutated att recombination site. (1), (11), (11), (11), vectors and methods from the present invention are used for the recombinational cloning of nucleic acid molecules. They can be used for changing vectors, targeting gene products to intracellular locations, cleaving fusion tags from genie proteins, operably linking nucleic acid molecules of interest to regulatory genetic sequences, constructing genes for fusion proteins, changing copy number, changing replicons, cloning into phages and cloning. (1), (11), (111), host cells and vectors can be used in the production of polypeptides and antibodies. The present sequence is used in the exemplification of the present invention. \$

Isolated nucleic acid molecules encoding an attB1, attB2, attP1, attP2, attL1, attL2, attR1, and attR2 nucleotide sequence useful for the recombinational cloning of polypeptides -

Example 5; Fig 43; 459pp; English.

The present invention describes isolated nucleic acid molecules (1) encoding an attB1, attB2, attB1, attB2, attL1, attL2, attR1, and attR2 nucleotide sequence. Also described are: (1) an isolated nucleic acid molecule (II) comprising one or more att recombination sites comprising at least one mutation in its core region that increases the specificity of interaction between the recombination site and a second att recombination site, and (2) an isolated nucleic acid molecule (III)

```
comprising one or more mutated att recombination sites comprising at least one mutation in its core region that enhances the efficiency of recombination between a first nucleic acid molecule comprising the mutated att recombination site and a second nucleic acid molecule comprising a second recombination site that interacts with the mutated att recombination site. [1], (II), (III), primers, vectors and methods att recombination are used for the recombinational cloning of nucleic acid molecules. They can be used for changing vectors, targeting gene products to intracellular locations, cleaving fusion tags from desired proteins, operably linking nucleic acid molecules of interest to regulatory genetic sequences, constructing genes for fusion proteins, changing copy number, changing replicons, cloning into phages and cloning. (I), (II), (III), host cells and vectors can be used in the production of polypeptides and antibodies. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes isolated nucleic acid molecules (1) encoding an attB1, attB2, attB1, attB2, attL1, attL2, attR1, and attR2 nucleotide sequence. Also described are: (1) an isolated nucleic acid molecule (II) comprising one or more att recombination sites comprising at least one mutation in its core region that increases the specificity of interaction between the recombination site and a second att recombination site; and (2) an isolated nucleic acid molecule (III)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated nucleic acid molecules encoding an attB1, attB2, attP1, attL1, attL1, attL1, and attR2 nucleotide sequence useful for the recombinational cloning of polypeptides -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bacteriophage lambda; att; recombination site; attB; attB; attL; mutant; recombinational cloning; entry vector; destination vector; gene product targeting; fusion tag cleavage; ds.

```
comprising one or more mutated att recombination sites comprising at least one mutation in its core region that enhances the efficiency of recombination between a first nucleic acid molecule comprising the mutated att recombination site and a second nucleic acid molecule comprising a second recombination site that interacts with the mutated comprising a second recombination site (II), (III), primers, vectors and methods from the present invention are used for the recombinational cloning of nucleic acid molecules. They can be used for changing vectors, targeting gene products to intracelular locations, cleaving fusion tags from the present contracelular locations, cleaving fusion tags from regulatory genetic sequences, constructing genes for fusion proteins, changing replicons, cloning into phages and claning (II), (III), host cells and vectors can be used in the production of polypeptides and antibodies. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes isolated nucleic acid molecules (I) encoding an attB1, attB2, attB1, attB2, attL1, attL2, attR1, and attR2 nucleotide sequence. Also described are: (I) an isolated nucleic acid molecule (II) comprising one or more attraccombination sites comprising at least one mutation in its core region that increases the specificity of interaction between the recombination site and a second attraccombination site; and (2) an isolated nucleic acid molecule (III)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated nucleic acid molecules encoding an attB1, attB2, attP1, attP2, attL1, attL2, attR1 aud attR2 nucleotide sequence useful for the recombinational cloning of polypeptides -

AASO6174-AASO6322 represent Bacteriophage lambda att recombination site nucleic acid sequences, and PCR primers of the invention. The att sequences are recognised by the recombination protein lambda att sequences are recognised by the recombination protein lambda integrase (Int). The invention is a new method of producing a population of hybrid nucleic acids comprising mixing at least a first population of nucleic acids comprising one or more recombination sites with at least causing some or all of the nucleic acids to recombine with all or some of the target nucleic acids acids to recombine with all or some of the target nucleic acids to see as an or accombine with all or some of the target nucleic acids which may be the same or different. The nucleic acids may be used to express therapeutic proteins by expressing different sequences like to each other. The method allows simultaneous cloning of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 43 BP; 20 A; 5 C; 11 G; 7 T; 0 other;

attP1, attP2, for the isolated nucleic acid molecules encoding an attB1, attB2, attL1, attL2, attR1, and attR2 nucleotide sequence useful attii, attii, attki, and attki nucleotid recombinational cloning of polypeptides

Disclosure, Fig 42; 459pp; English.

The present invention describes isolated nucleic acid molecules (I) encoding an attB1, attB2, attB1, attB2, attL1, attL2, attR1, and attR2 nucleotide sequence. Also described are: (I) an isolated nucleic acid molecule (II) comprising one or more att recombination sites comprising at least one mutation in its core region that increases the specificity of interaction between the recombination site and a second att recombination site; and (2) an isolated nucleic acid molecule (III) 

comprising one or more mutated att recombination sites comprising at least one mutation in its core region that enhances the efficiency of recombination between a first nucleic acid molecule comprising the mutated att recombination site and a second nucleic acid molecule comprising a second recombination site that interacts with the mutated att recombination site and a second nucleic acid molecule.

Tre comprising a second recombination site that interacts with the mutated att recombination site. [1], [11], [11], primers, vectors and methods from the present invention are used for the recombinational cloning of nucleic acid molecules. They can be used for changing vectors, targeting gene products to intracellular locations, cleaving fusion tags from esquatory genetic sequences, constructing genes for fusion proteins, changing copy number, changing replicons, cloning into phages and cloning (0) [11], [11], host cells and vectors can be used in the production of polypeptides and antibodies. The present sequence is used in the exemplification of the present invention. 55555555555555555X8

```
merabolite by a rungues. This involves modulating the expression of at least one ZBC (zinc binuclear duster protein) gene in a manner to improve the yield of the secondary metabolite. Methods of the invention may be used for improving the production of the secondary metabolite e.g. antibacterial (such as beta-lactam), an anti-hypercholesterolaemic (such as lowastin or mevastatin), an immunosuppressant (such as cyalicin), a glucan synthase inhibitor; gliotoxin family of compounds, a fungal toxin, a modulator of cell surface receptor signalling, a plant growth regulator, a pigment, an insecticide, or an antineoplastic compound. The method results in a decrease in fermentor run-time, a decrease in the size of the fermentor required for the production of equivalent amounts of the secondary metabolite, or a decrease in the biase of the fermentor required for the production of equivalent amounts of the secondary metabolite, or a decrease in the biases required for the production, which translates into decreased waste that must be handled in downstream processing. The sequences given in records ABISSSS7ABISSSS represent primers that are used in construction of vectors containing the ZBC genes of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained directly from WIPO at
metabolite by a fungus. This involves modulating the expression of at least one ZBC (zinc binuclear cluster protein) gene in a manner to

Isolated nucleic acid molecules encoding an attB1, attB2, attP1, attP2, attL1, attL2, attR1, and attR2 nucleotide sequence useful for the recombinational cloning of polypeptides -

Producing hybrid nucleic acids, useful for expressing novel therapeutic polypeptides, by mixing the same or different nucleic acids having one or more recombination sites in the presence of recombination proteins,

The present invention describes isolated nucleic acid molecules (I) encoding an attB1, attB2, attP1, attP2, attR1

```
nucleotide sequence. Also described are: (1) an isolated nucleic acid molecule (II) comprising one or more att recombination sites comprising at least one mutation in its core region that increases the specificity of interaction between the recombination sites and (2) an isolated nucleic acid molecule (III) comprising one or more mutated att recombination sites comprising at least one mutation in its core region that enhances the efficiency of recombination between a first nucleic acid molecule comprising the mutated att recombination site and a second nucleic acid molecule comprising the mutated att recombination site. (1), (III), primers, vectors and methods from the present invention are used for the recombinational cloning of nucleic acid molecules. They can be used for changing vectors, targeting ene products to intracellular locations, cleaving fusion tags from the present intracellular locations, cleaving fusion tags from desired proteins, operably linking nucleic acid molecules of interest to regulatory genetic sequences, constructing genes for fusion proteins, changing replicons, cloning into phages and cloning (1), (II), (III), host cells and vectors can be used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                  0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bacteriophage lambda; recombination; att site; PCR primer; lambda Int; lambda integrase; therapeutic; ss.

The invention relates to a novel method for producing plant artificial chromosomes. The invention also relates to methods for targeting chromosomes. The invention also relates to methods for targeting chromosomes. The thromosomes to selected cells and thromosome, methods for delivery of plant chromosome (PAC) is useful for producing a isolated plant artificial chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous nucleic acid encoding a gene product such as enzymes, antisense RNA, ENNA, structural proteins, marker proteins, ligands, receptors, ribozymes, therapeutic proteins, and compressed in proteins, and decreased acid actors, antigens, hord factors, antigens, hord factors, antigens, hord factors, antigens, normones, cresistance to diseases, insects, herbicides, or stress in a plant. The resistance to diseases, insects, herbicides, or stress in a plant. The agronomically important trait in the plant, e.g. a product that alters contrined such and/or improves the nutrient quality of the plant. The chromosome (BAC) or a yeast artificial chromosome (YAC). This chromosome (PAC) or a yeast artificial chromosome (YAC). This producing plant artificial chromosomes of the invention.

Improving production of secondary metabolite by fungus, for producing proteins of interest, involves modulating the expression of gene involved in regulation of secondary metabolite production

Example 1; Page 67; 139pp; English

The present sequence is a primer which was used in an example illustrating an invention relating to a method for improving production of a secondary metabolite by a fungus. The method involves modulating the expression of a gene involved in the regulation of secondary metabolite production. The gene may be modulated in a manner that increases the yield or productivity of metabolite, increases the yield or productivity of metabolite, increases (see felux or excretion of the metabolite, decreases production of side effects or competing metabolites, alters the characteristics of the fungus in a manner that is beneficial to the production of the metabolite, causes conditional lysis of the fungus, or increases the resistance of the fungus to deleterious effects of exposure to the secondary metabolite. The method is useful for producing secondary metabolites such as antibacterial compounds, conditional tentorial compounds, condary metabolites such as antibacterial compounds. antihypercholesterolaemic compounds, immunosuppressants, modulators of cell surface receptor signalling, plant growth regulators, pigments, insecticides or anti-neoplastic compounds. The present sequence was production in the preparation of clones to regulate secondary metabolite production used X2222222222

The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is heterologous to the chromosome, and permits site-directed integration in the presence of chromosome. CC chromosome, and permits site-directed integration in the presence of lambda-integrase. Also described: (I) a platform artificial chromosome expression system (ACCS) (II) comprising several sites that participate in recombinase crallysed recombination; and (2) a method (MI) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (MI) is useful for chromosome, preferably an ACCS. (II) is useful for producing a ratificial chromosome, preferably an ACCS. (II) is useful for producing cranical chromosome, speterably an ACCS. (II) is useful for producing cranical chromosome, microcinlediction, ilpid-mediated transfection, marmal) by introducing (II) by cell fusion, lipid-mediated transfection, microprojectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for making a library of ACCS comprising random portions of a genome. ACC44612 cto ACC44732 and ABP95650 to ABP95657 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                 Novel eukaryotic chromosome comprising one or many att sites which permits site-directed integration in the presence of lambda-integrase, useful for site-specific recombination-directed integration of DNA of

The invention relates to inserting a population of nucleic acids into a second target molecule. The method involves (a) mixing a first population of nucleic acid comprising one or more recombination sites with a target nucleic acid, (b) causing some or all of the nucleic acid molecules of the first population to recombine with the first earget nucleic acid molecules of nucleic acid with a second population; (c) mixing the second population of nucleic acid with a second target nucleic acid, and (d) causing some or all of the nucleic acid molecules of the second population to recombine with some or all of the second target nucleic acid molecules to form a third population of nucleic acid. The method is useful for

selecting and isolating nucleic acid molecules. Sequences ABZ58727-762 represent att recombination site sequences used in the method of the

Inserting a population of nucleic acids into a second target molecule for selecting and isolating nucleic acid molecules by mixing the second population of nucleic acid with a second target nucleic acid -

The present invention describes a vector (I) comprising operably linked DNA fragments having: (a) origin of replication allowing replication in a recipient cell, preferably in bacteria such as Bacherichia coli; (b) selectable marker region capable of being expressed in the recipient cell; and (c) a chimeric DNA construct comprising: (i) promoter or promoter region capable of being recognized by RNA polymerases of a cukaryotic cell or by prokaryotic RNA polymerase; (ii) first, second, third and fourth recombination sites; (iii) 3' transcription terminating and polyadenylation region functional in the eukaryotic cell. The first and fourth recombination sites, or the second and third recombination sites are capable of reacting with a same recombination site, and preferably are identical. The first and second recombination sites, or the third and fourth recombination sites in our recombination site, or the third and fourth recombination site. The vector is useful for producing large amounts of double-stranded RNA which can be used for allending target mucleic acid sequences. The vectors can also be used to convert a DNA fragment into an inverted repeat structure. Plants transformed with a vector from the present invention can be used in a convertional breeding scheme to produce more plants with the same characteristics or to introduce a chimeric gene for reduction of the present sequence represents expression of nucleic acids. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Chromosome-based platform, artificial chromosome; eukaryotic chromosome; att site; integrase; recombinase; ACes; gene therapy; transgenic animal; platform artificial chromosome expression system; PCR primer; ss.
                                                                                                                                                                                           New vectors comprising operably linked DNA fragments having an origin of replication, a selectable marker and a chimeric DNA construct, useful for silencing target nucleic acids and for producing large amounts of double-stranded RNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes an isolated nucleic acid molecule (I) comprising a first nucleic acid sequence having a defined sequence (AAC87866 to AAC87881, sequences complementary to AAC87881, or an RNA sequence corresponding to AAC87866 to AAC87881, or an RNA sequence corresponding to AAC87866 to AAC87881. Also described are: (1) an isolated nucleic acid molecule (II) comprising a first mutated recombination site that removes one or more stop codons from the recombination site of a size and isolated nucleic acid molecule (III) comprising a first att recombination site comprising a mutation that comprising a first att recombination site comprising a mutation that above mentioned nucleic acids; and (4) cells comprising the above mentioned nucleic acids or (IV). The nucleic acids are used in mutative sites suitable for subcloning reactions in vito or in vivo makes the methods for Data RNA subcloning, highly specific, rapid, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                Isolated nucleic acid molecules comprising a DNA segment having two engineered recombination sites, derived from att or lox, which flank a selectable marker and comprise a core region having an engineered

AASO6174-AASO6322 represent Bacteriophage lambda att recombination attenucleic acid sequences, and PCR primers of the invention. The att sequences are recognised by the recombination protein lambda integrase (Int). The invention is a new method of producing a population of hybrid nucleic acids comprising mixing at least a first population of nucleic acids comprising one or more recombination sites with at least one target nucleic acids comprising one or more recombination sites and causing some or all of the nucleic acids to recombine with all or some of the target nucleic acids which may be the same or different. The nucleic acids which may be the same or different. The nucleic may also be used to express therapeutic proteins or peptides and they may also be used to cach other. The method allows simultaneous cloning of two or more different nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Producing hybrid nucleic acids, useful for expressing novel therapeutic polypeptides, by mixing the same or different nucleic acids having one or more recombination sites in the presence of recombination proteins,
                                                                                                                                                                                                                                 Bacteriophage lambda; recombination; att site; PCR primer; lambda Int;

The present invention relates to a method for in vitro cloning of a nucleic acid of interest. The method involves mixing in vitro two vectors each comprising at least one recombination site and the nucleic acid of interest; incubating the mixture in the presence of at least one recombination protein to result in recombination of the recombination sites, leading to production of a chimeric nucleic acid molecule comprising the nucleic acid of interest; contacting hosts with the mixture, and selecting for a host comprising the vectors comprising the second vectors comprising the second vectors comprising the second vectors comprising the second vectors comprising the recombinantion site, which may be used in the method of the present
                                                                                                                                                                                                                                                                                                                                                                                   In vitro cloning of nucleic acid involves mixing vectors comprising recombination sites and/or nucleic acid, incubating mixture to produce chimeric molecule, contacting hosts with mixture and selecting host -

                                                                    AAT48210-25 are att recombination site core region DNA sequences. The cree region has at least one engineered mutation that enhances recombination in vitro in the formation of a Cointegrate or Product DNA. These core regions can be incorporated into novel vector donc DNA molecules. The nucleic acids, vectors and methods of the invention are used to obtain chimeric nucleic acid using recombination proteins and engineered recombination sites in vitro or in vivo. The improved specificity, speed and yields of the invention facilitates DNA or RNA subcloning, regulation or exchange useful for any related purpose, e.g. in vitro recombination of DNA segments, and in vitro or in vivo insertion or modification of transcribed, replicated, isolated or genomic DNA or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to novel methods for cloning or subcloning one or more nucleic acid molecules (NAMS) comprising: (a) combining in vitro or in vivo: (1) at least one insert donor molecules (IDMS) comprising one or more desired nucleic acid segments flanked by at least 2 recombination sites which do not recombine with each other; (2) one or more vector donor molecules (VDMS) comprising at least 2 recombination sites which do not recombine with each other; and (3) one or sites which do not recombine with each other; and (3) one or more site-specific recombination porteins; (b) incubating the combination to transfer one or more of the desired segments into one or more of the WDMs, thereby producing one or more desired product molecules (PMS). The methods can be used for the efficient and specific recombination of NAM segments. They can be used to generate chimeric DNA or RNA molecules that

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method for apposing an expression signal and a gene or partial gene, using recombinatorial cloning. The method incubates nucleic acids comprising the expression signal and the gene/ partial gene in the presence of a recombination protein under conditions sufficient to cause recombination and therefore appose the expression signal and the gene or partial gene. The methods are useful for apposing an expression signal and a gene or partial gene using recombinatorial cloning. The methods are also useful for changing vectors, constructing genes for fusion proteins, changing copy number, changing replicons, at one end and a loxP site at the other end), genomic DNAs, and cDNAs. The methods are highly specific, rapid, and less labour intensive than prior art methods. The present sequence is a recombination site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        a gene/partial gene, using recombinatorial cloning by incubating the nucleic acids in the presence of a recombination protein under conditions for recombination -

                                                                                                                                                                                                                                                                                                                                                           During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations where differences are found these are annotated as variations together with a note of the overlapping clone amen. Note that the variation annotation may not be found in the sequence submission contresponding to the overlapping clone, as we submit sequences with monly a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Emt., EMBL; Swi, SWISSPROT; Tr., TREMBL; Wp., WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C elegans/wormpep Repeat names beginning 'Dr' were identified by the Recon repeat discovery system (Inther information see http://www/Projects/D_rerio/fishmask.shtml CHT1-27FBL; if from a CHORI-211 BAC library
